**Arthur Bauville**  
France

**Ettore Barbieri**  
Italy

The Demographic and Health Surveys (DHS) Program has collected, analyzed, and disseminated accurate and representative data on population, health, HIV, and nutrition through more than **400 surveys** in over **90 countries**.

Using data provided by the DHS Program we wanted to:

- ▶ Investigate the **acceptance vs the experience** of domestic violence
- ▶ Determine the **controlling factors** of domestic violence
- ▶ Develop a tool that would **quickly and efficiently identify women who are at risk** of domestic violence

## DHS Program data for acceptance and experience of domestic violence

► Acceptance: % of yes to at least one answer of:

It is the respondent's opinion that a husband is justified in hitting or beating his wife when:

**BASE:** For V744A to V744E is all women.

V744A

She goes out without telling him

V744B

She neglects the children

V744C

She argues with him

V744D

She refuses to have sex with him

► Experience: % of yes to at least one answer of:

### Physical violence

**BASE:** Women currently in union (V502 = 1).

Spouse ever pushed, shook or threw something.

Spouse ever slapped.

Spouse ever punched with fist or something harmful.

Spouse ever kicked or dragged.

Spouse ever tried to strangle or burn.

Spouse ever threatened with knife/gun or other weapon.

Spouse ever attacked with knife/gun or other weapon.

Spouse ever physically forced sex when not wanted.

Spouse ever forced other sexual acts when not wanted.

Spouse ever twisted her arm or pulled her hair.

Physical violence

Physical violence

Physical violence

Physical violence

Experienced any less severe violence.

Experienced any severe violence.

Experienced any sexual violence.

# Acceptance vs experience of domestic violence

- ▶ Domestic violence is **widespread** amongst the countries surveyed by the DHS
- ▶ On average across all countries **26% of women** surveyed have experienced physical and/or sexual domestic violence
- ▶ Overall **more women than men** agreed that domestic violence was acceptable in certain circumstance

# Demographic of Respondents

5120 female and married respondents in Congo between 2013-2014

## Age

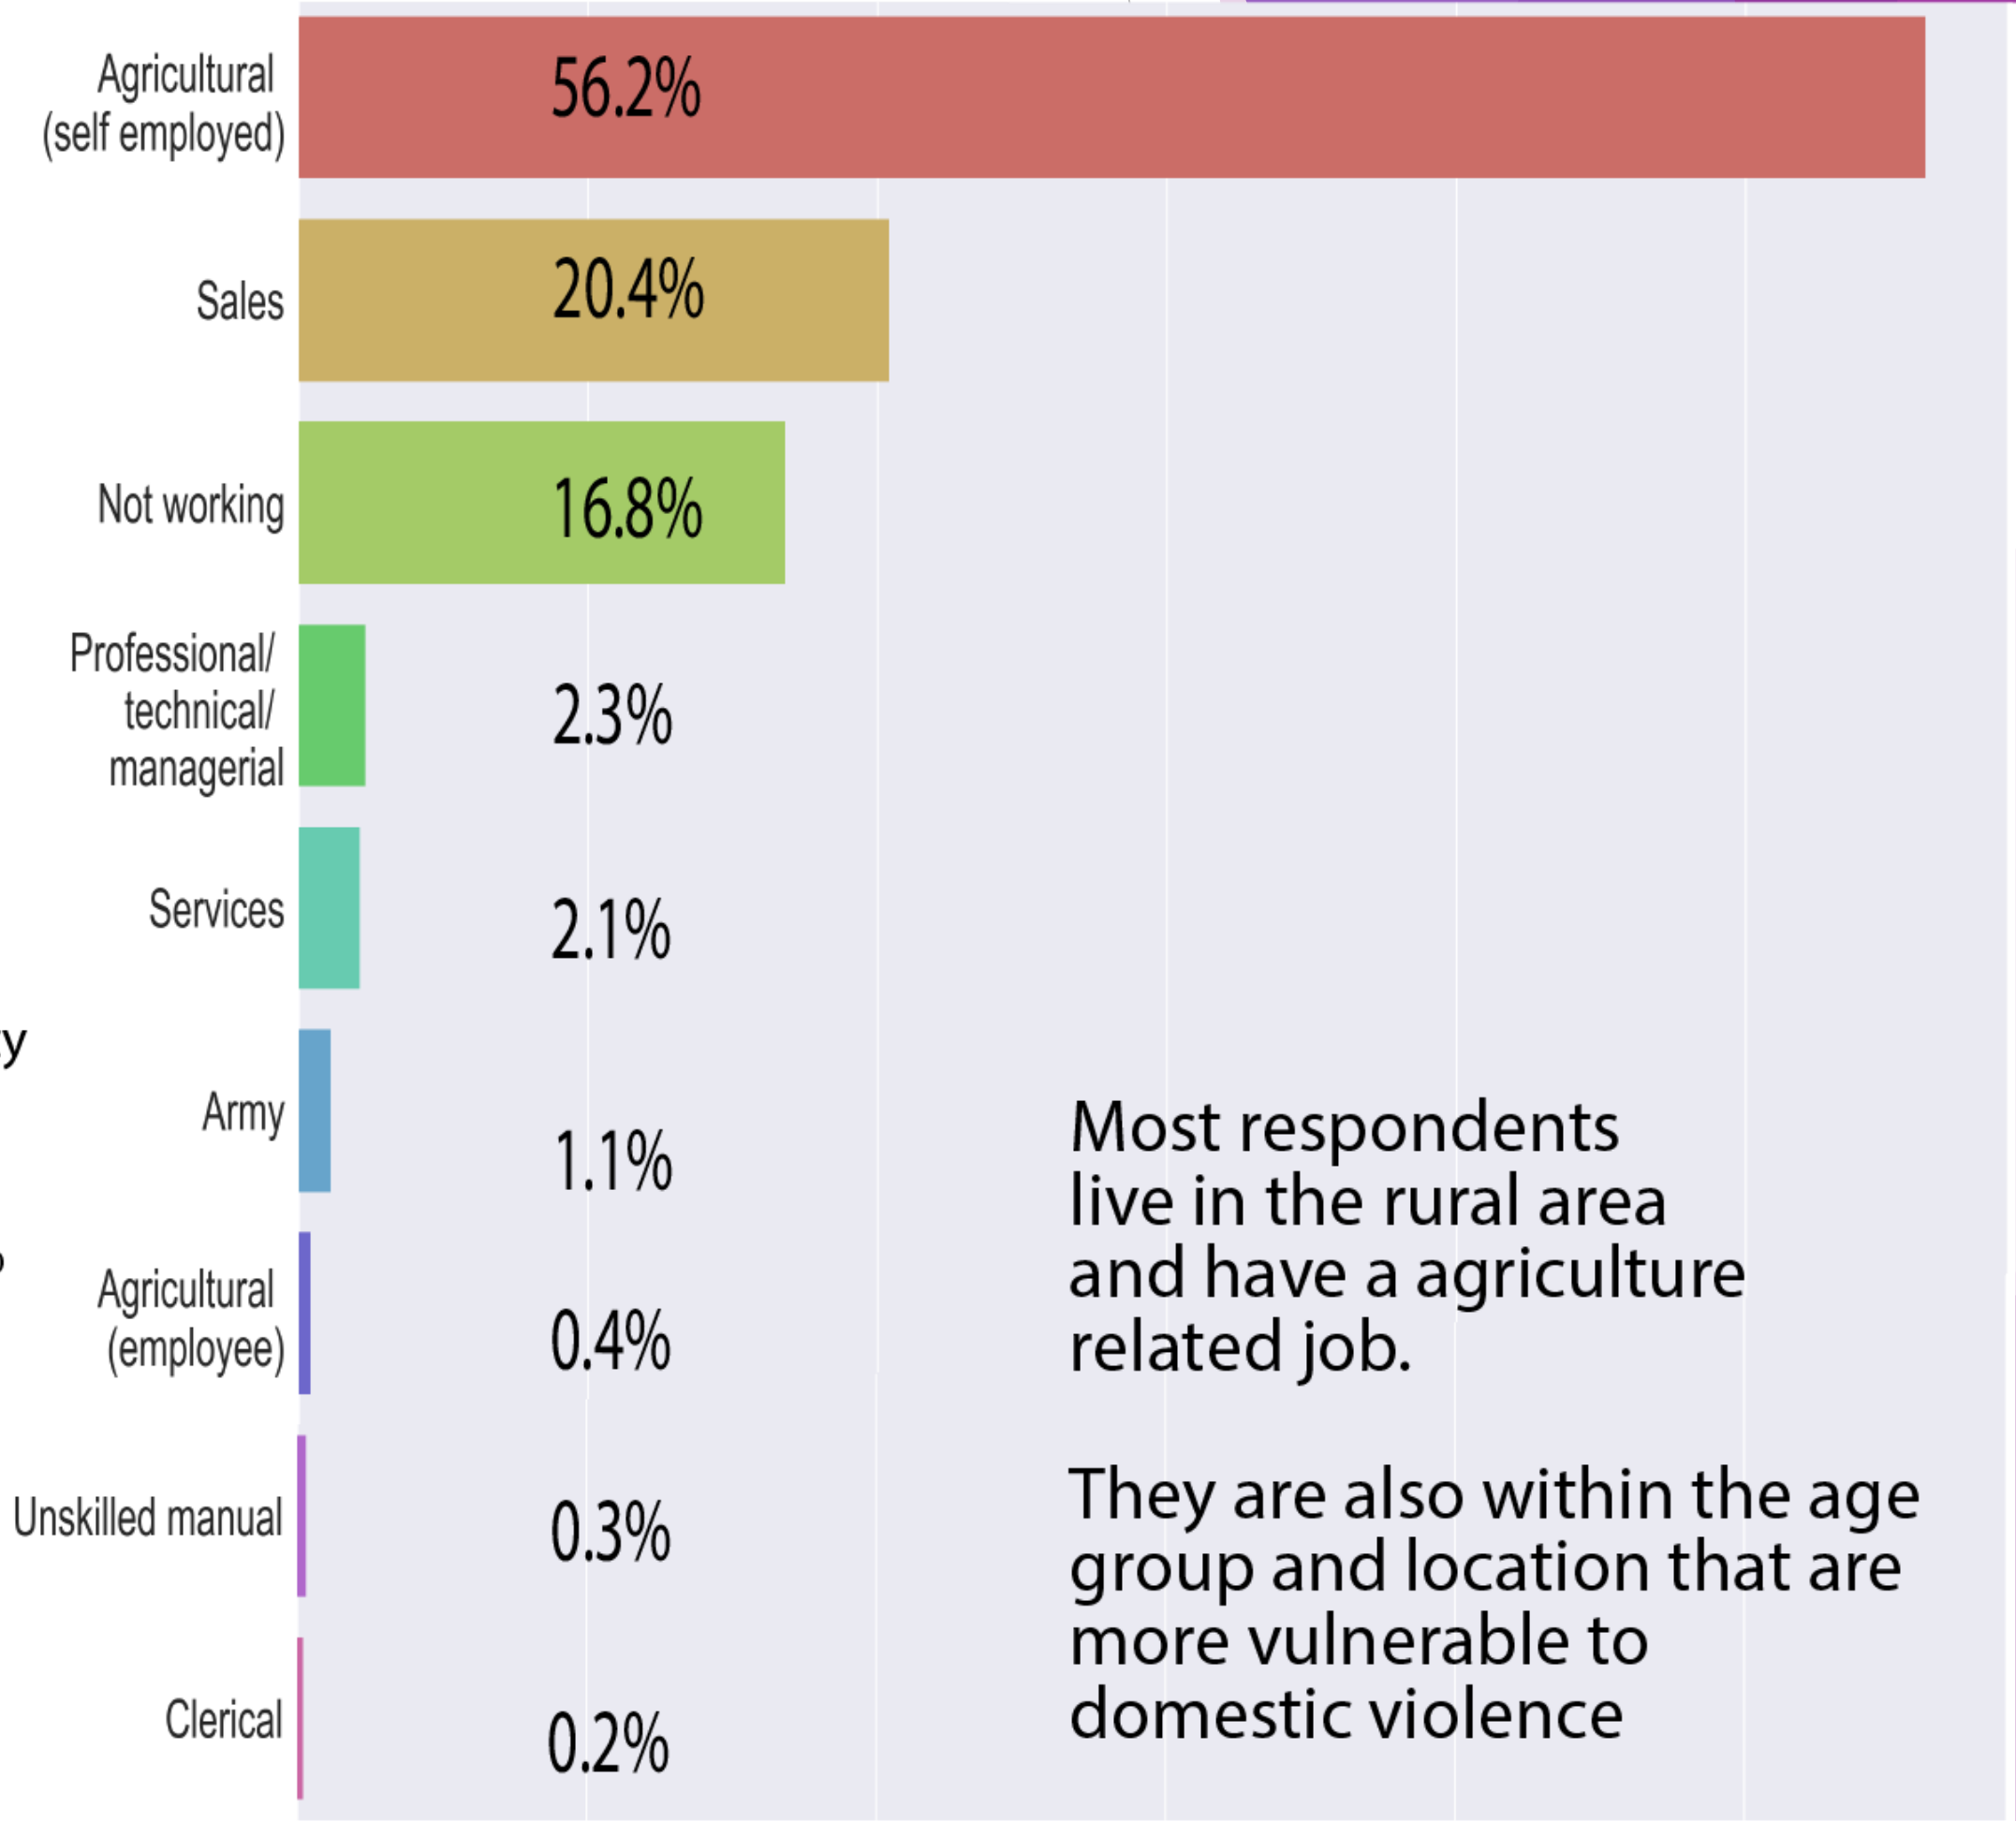

## Education

## Location

## Occupation

Most respondents live in the rural area and have a agriculture related job.

They are also within the age group and location that are more vulnerable to domestic violence

# Probabilities for experiencing types of domestic violence

## Case Study 1 - BENIN

$$P(B|A) = \frac{P(A \cap B)}{P(A)} =$$

**62.96%**

Probability of Experiencing Emotional violence after experiencing physical violence

BAYES' Theorem

$$P(A|B) = \frac{P(B|A) P(A)}{P(B)} =$$

**28.61%**

Probability of Experiencing physical violence after experiencing emotional violence

# Probabilities for accepting types of domestic violence

## Case Study 1 - BENIN

**40.62%**

Probability of Accepting violence after experiencing emotional violence

**47.09%**

Probability of Accepting violence after experiencing physical violence

# Probabilities for experiencing types of domestic violence

## Case Study 2 - CONGO

$$P(B|A) = \frac{P(A \cap B)}{P(A)} =$$

BAYES' Theorem

$$P(A|B) = \frac{P(B|A) P(A)}{P(B)} =$$

**50.53%**

Probability of Experiencing Emotional violence after experiencing physical violence

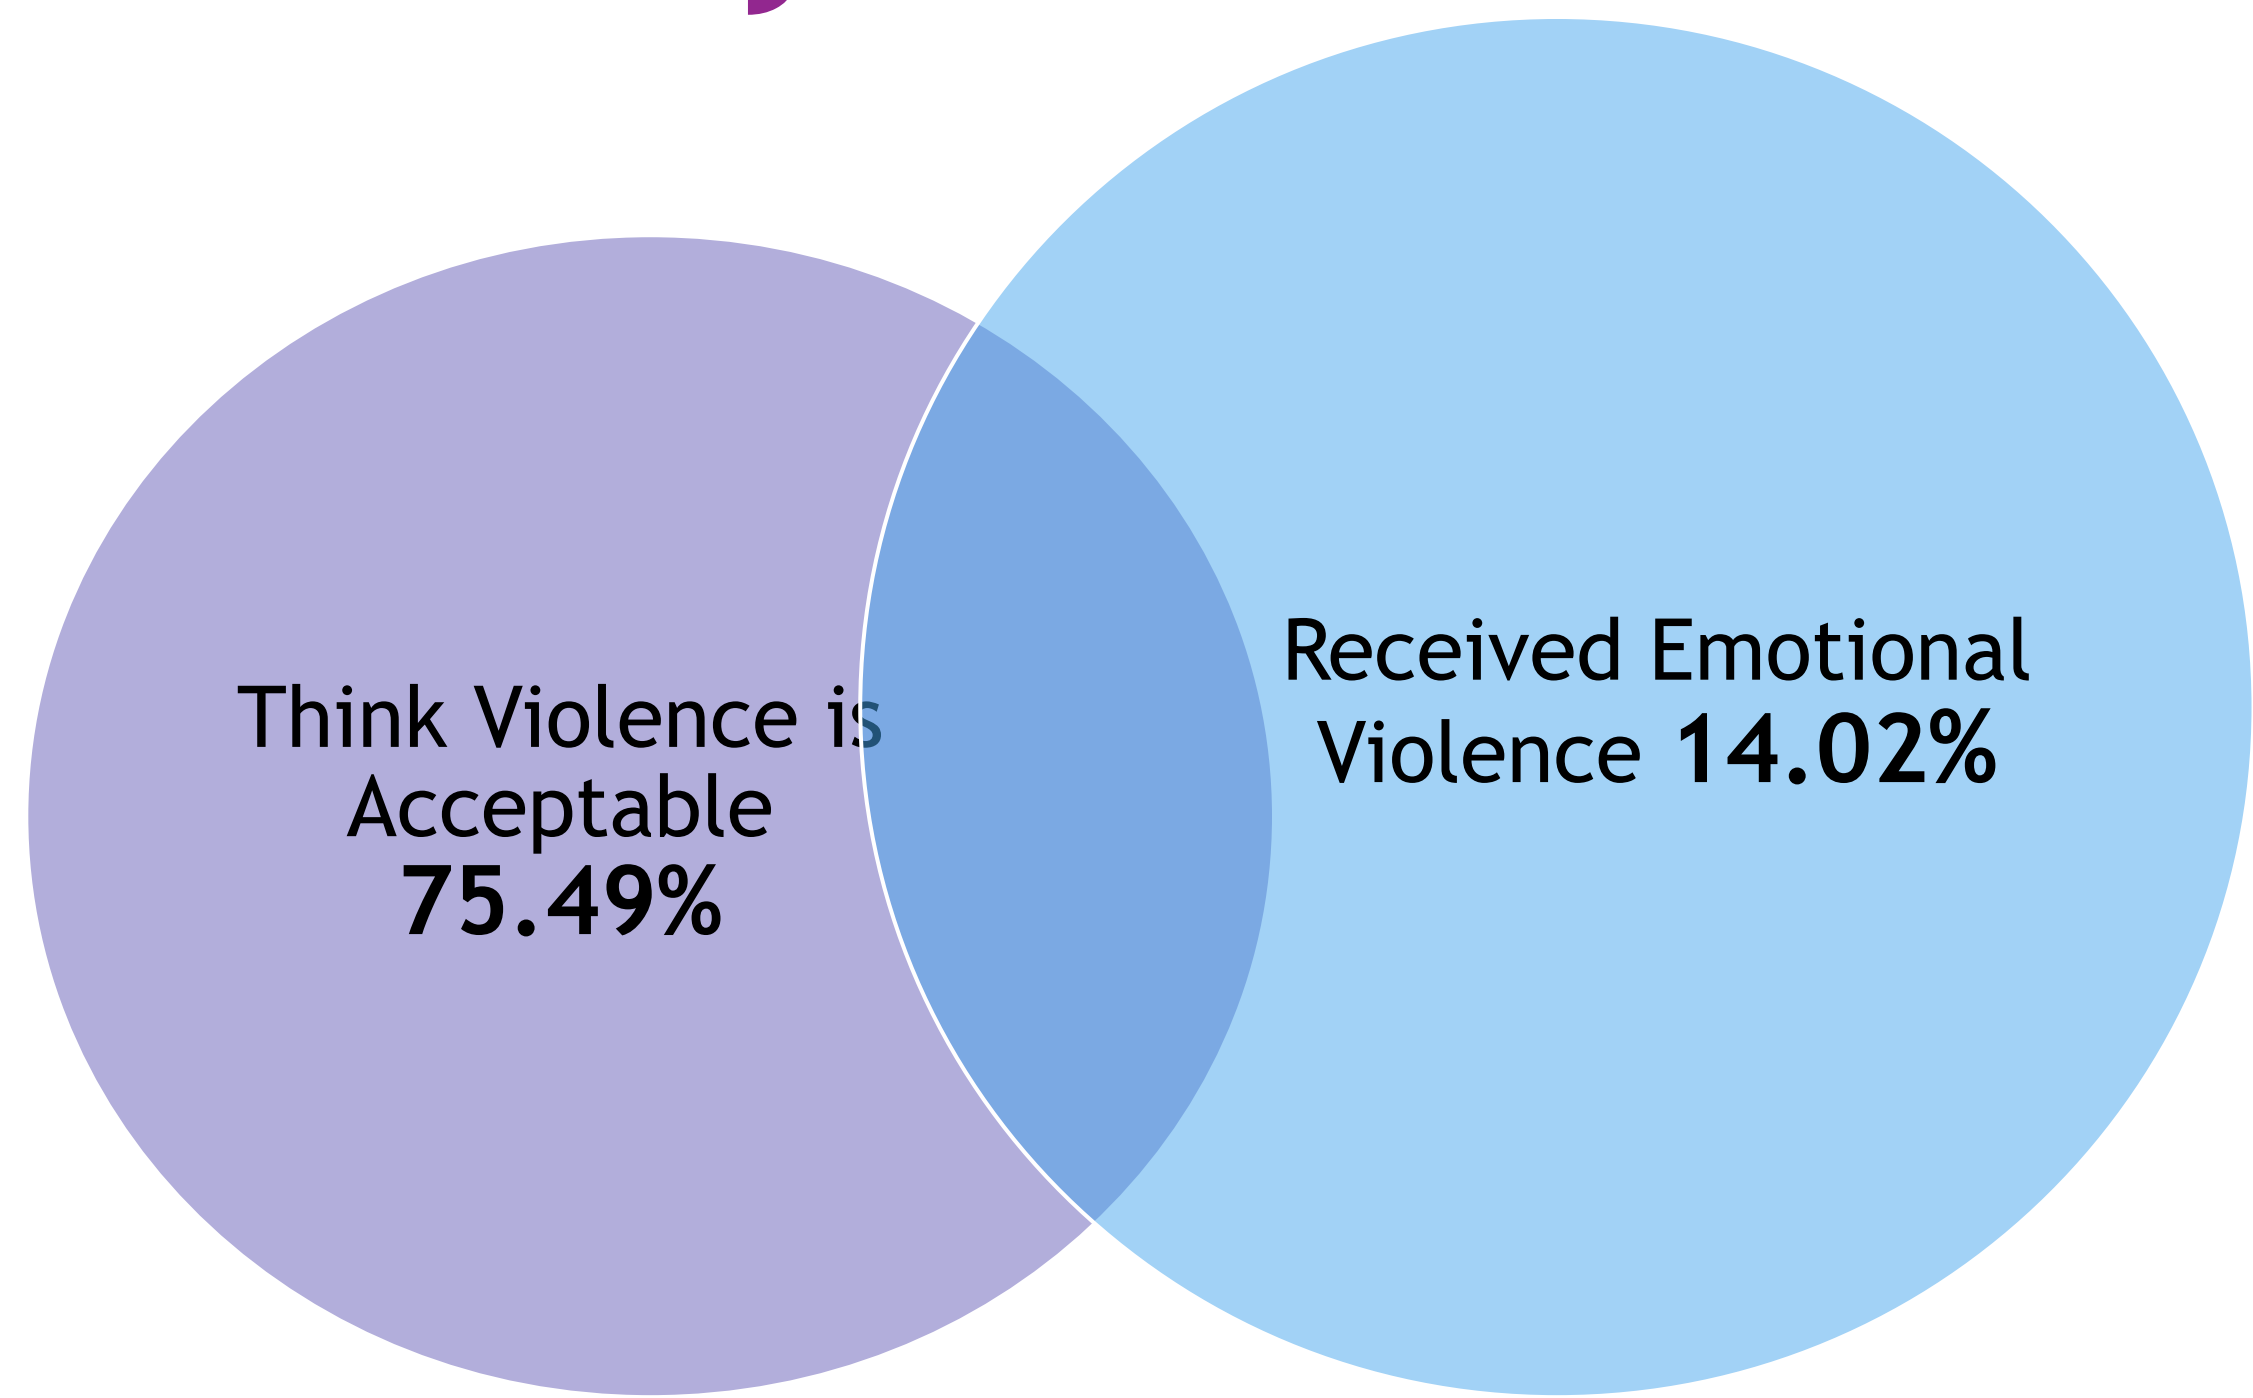

**66.71%**

Probability of Experiencing physical violence after experiencing emotional violence

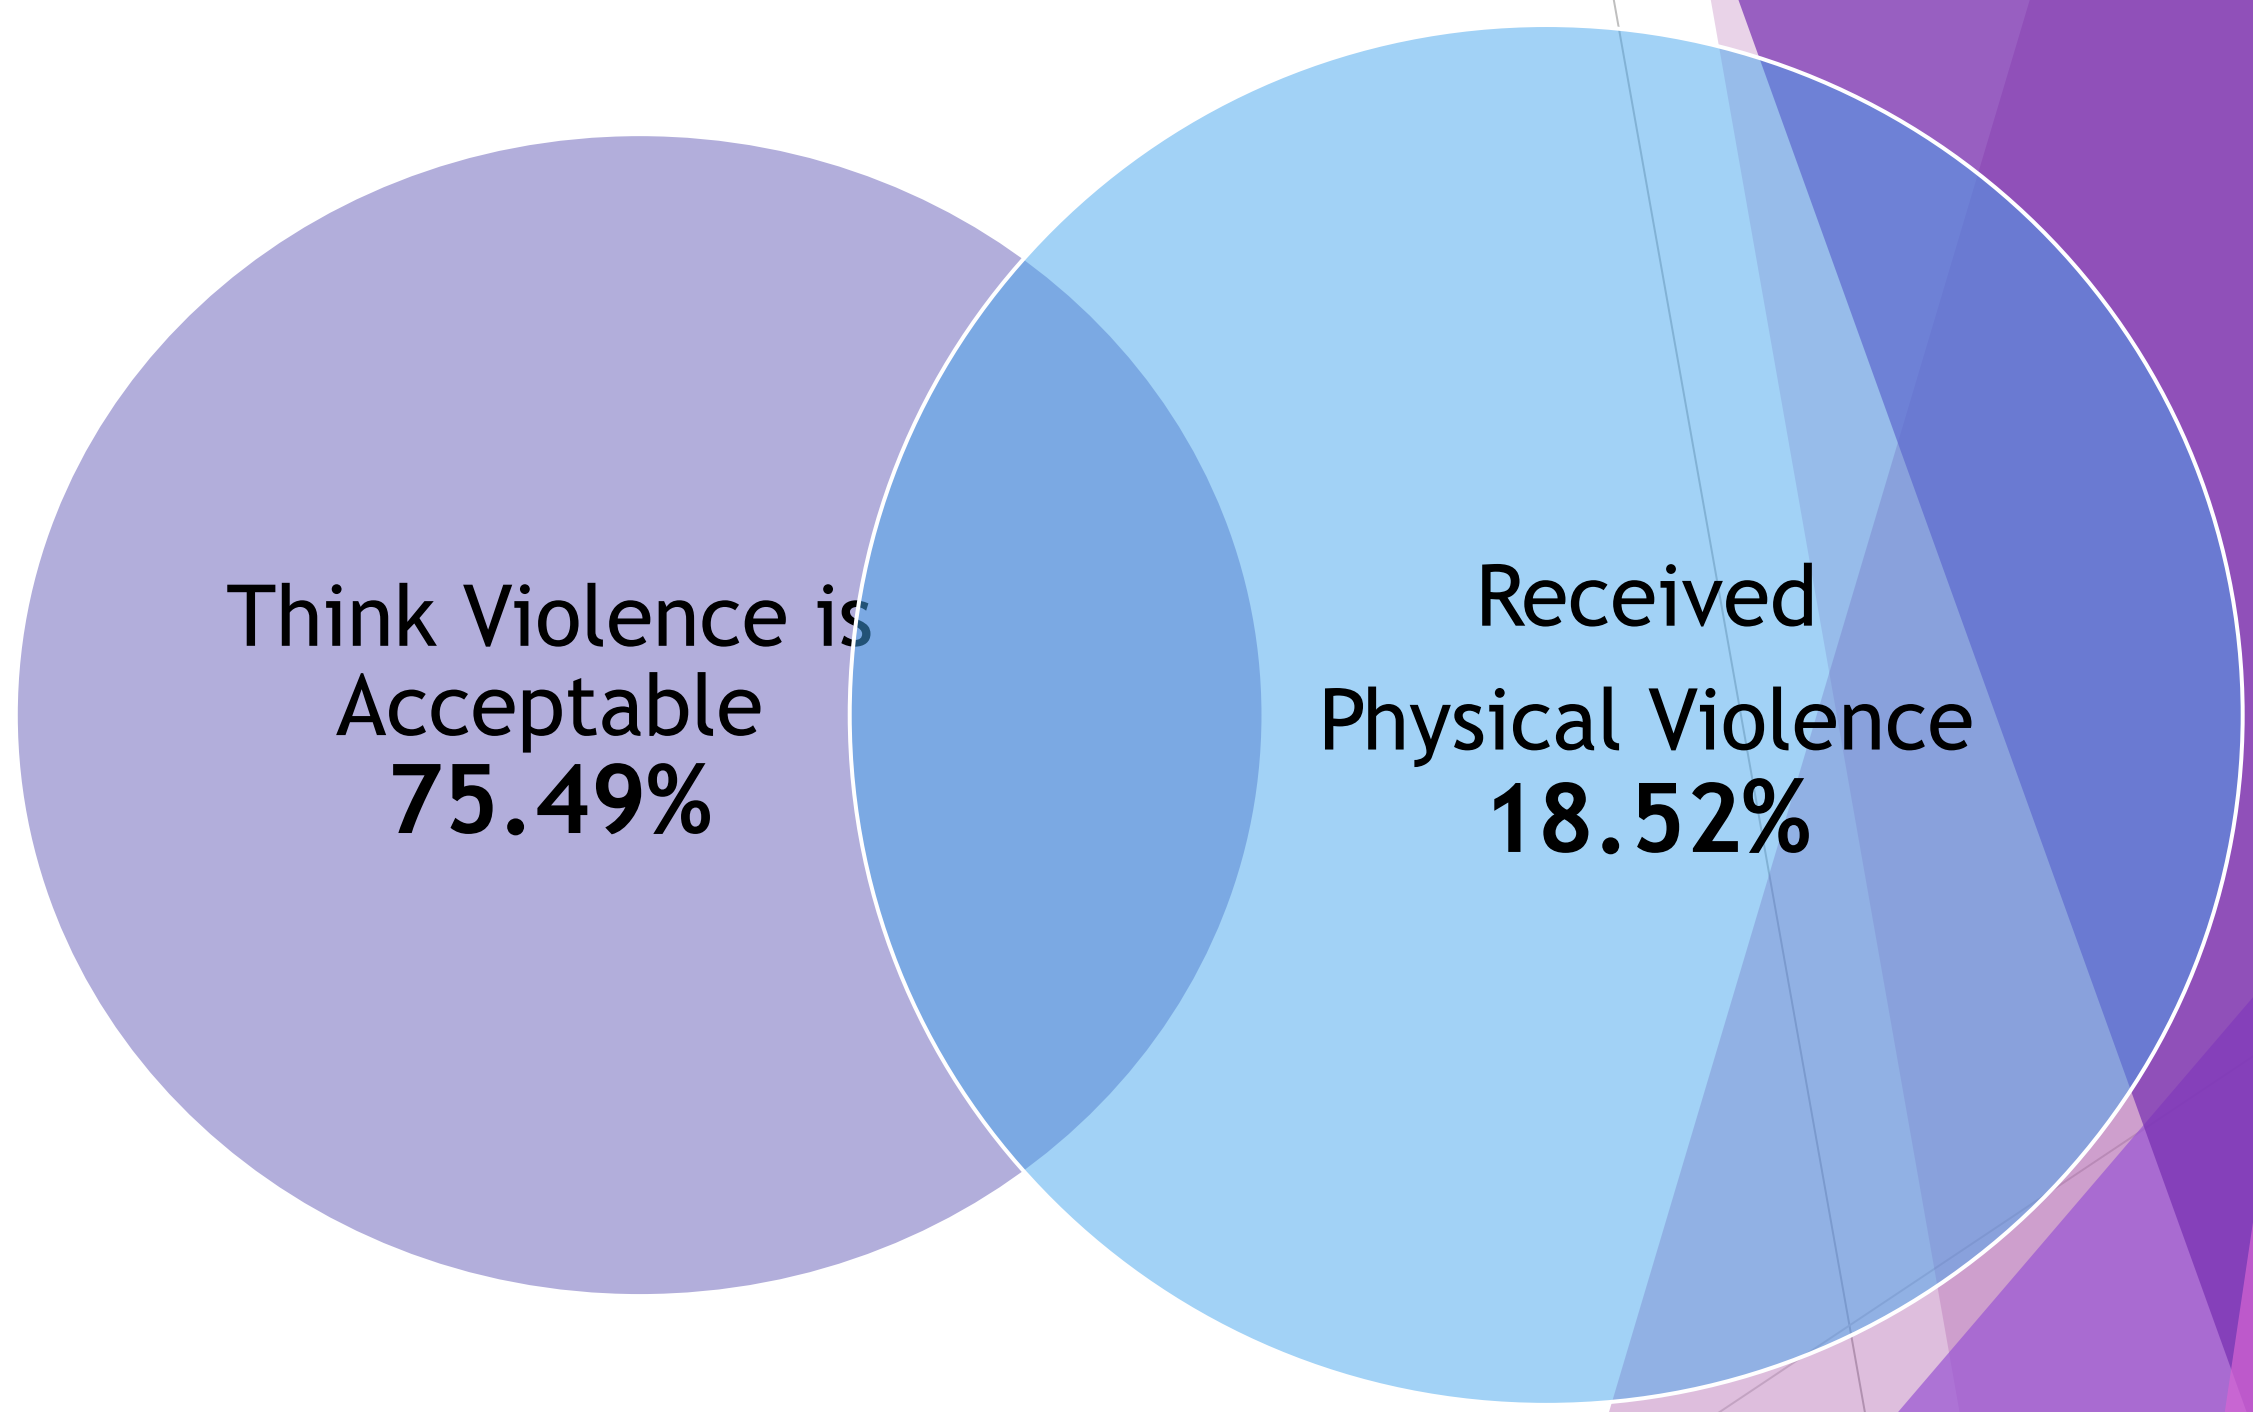

# Probabilities for accepting types of domestic violence

## Case Study 2 - CONGO

**86.63%**

Probability of Accepting violence after experiencing emotional violence

**87.24%**

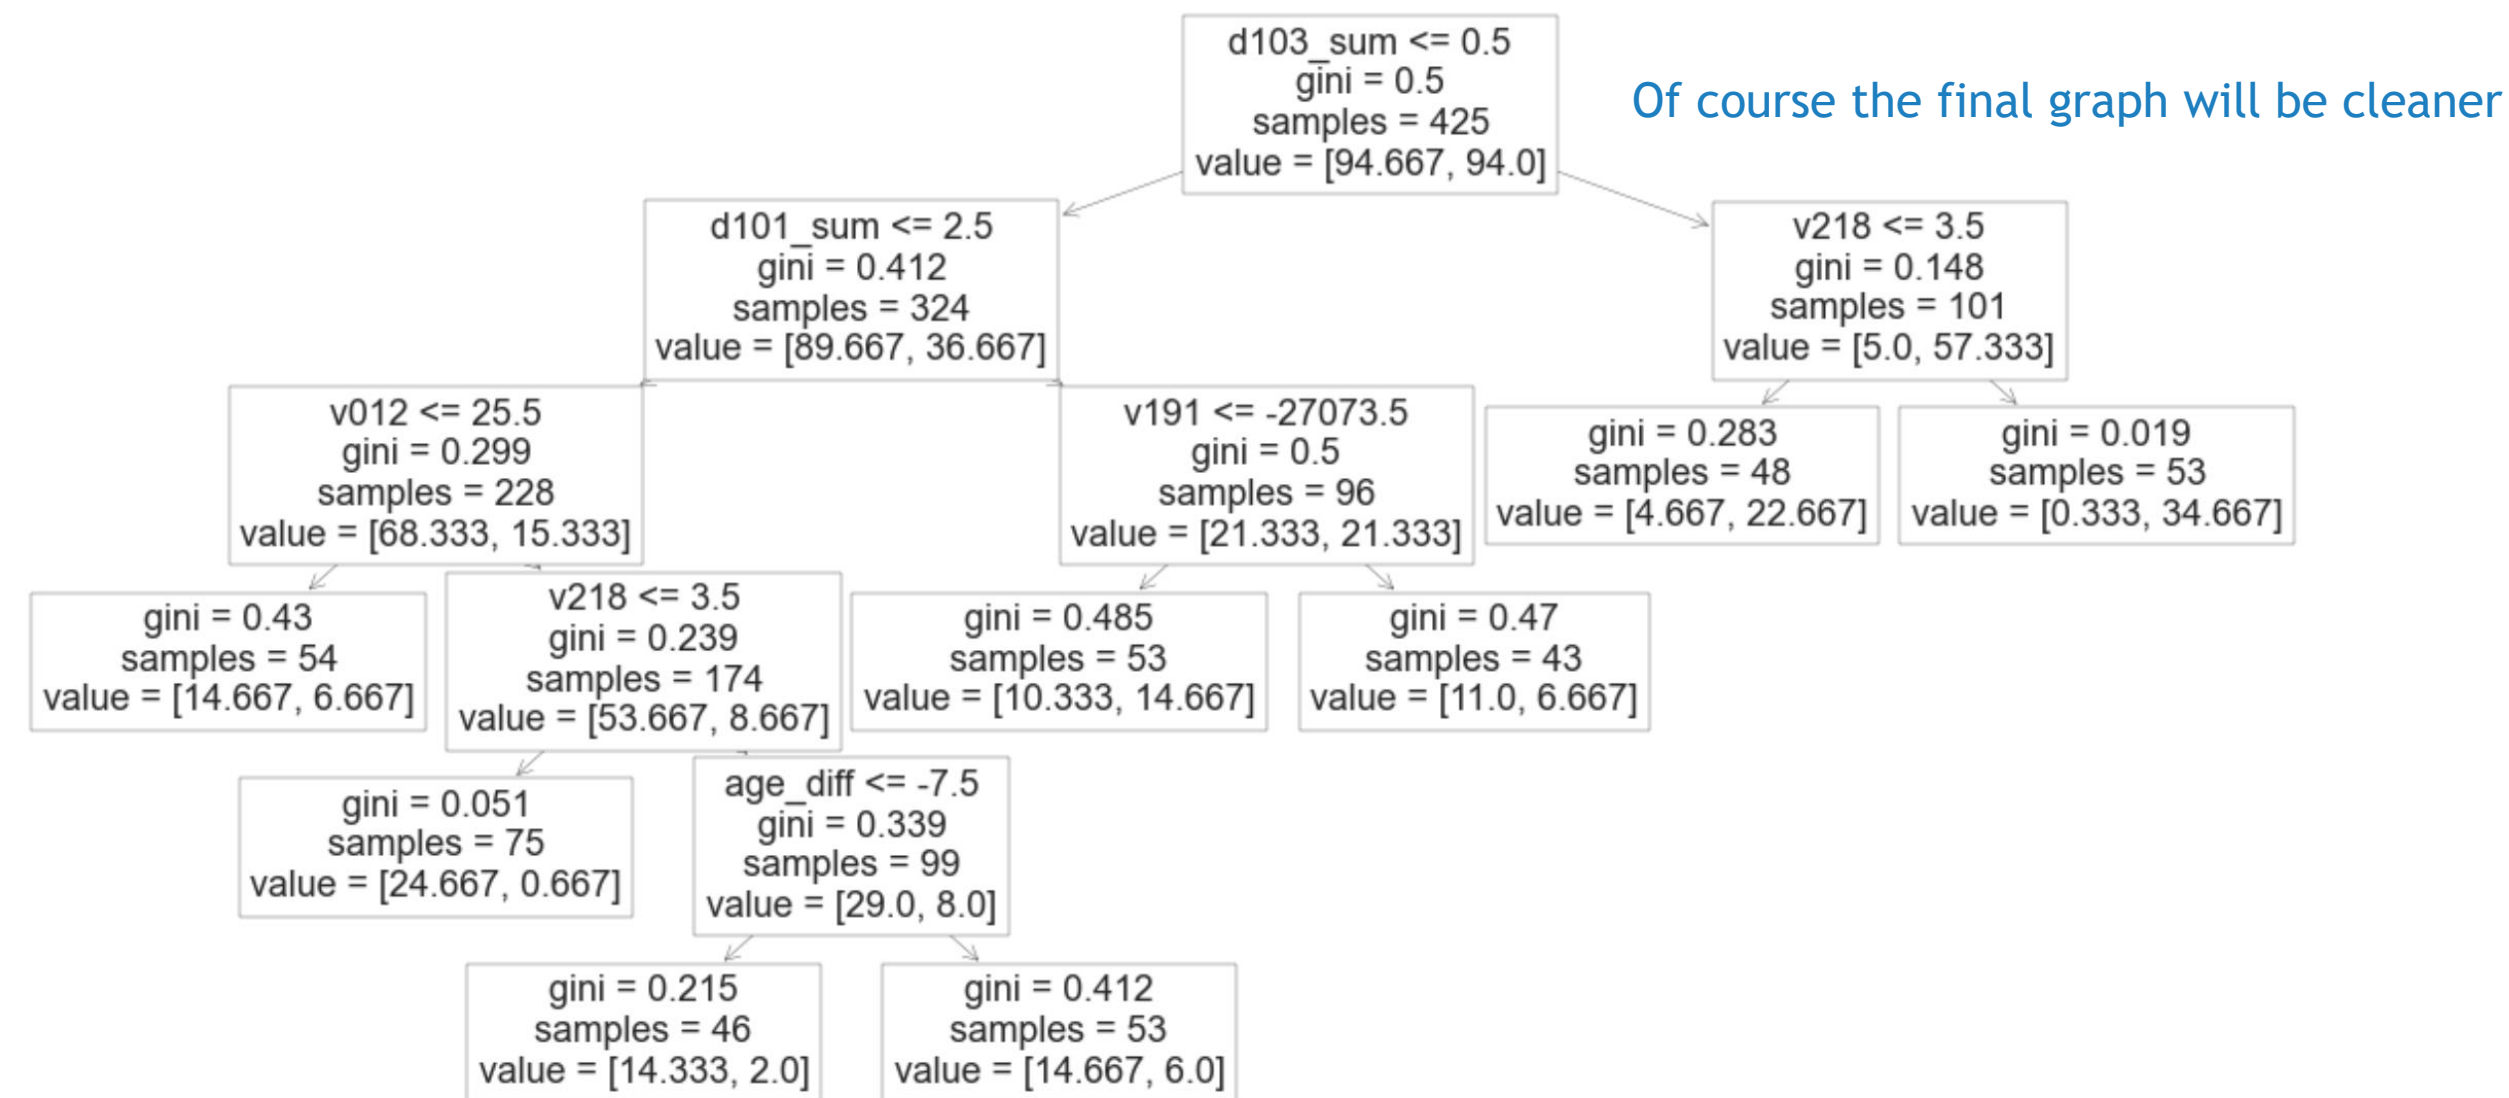

Probability of Accepting violence after experiencing physical violence

# Can we use these data to predict which women are at most risk of future violence?

# Diagnostic AI-tool

- ▶ We aim to predict whether a woman is susceptible to experience domestic violence
- ▶ We want a diagnostic test that can be performed in less than two minutes either automatically, on paper, or given by a non-expert.
- ▶ We chose a decision-tree for its “white-box” approach. The decision-tree proposes a short series of questions. Each new question is personalized in function of the previous answer, so that the size of the questionnaire can be really small.
- ▶ We obtain reasonably good results by asking less than five questions

# Conclusion
